fibers that protect the blood vessel and anchor it to surrounding structures. Page 4. Comparison of Arteries, Capillaries, and Veins • Let's compare and contrast the three types of blood vessels: arteries, capillaries, and veins. • Label the artery, capillary and vein. Also label the layers of each.

Anatomy Review: Blood Vessel Structure & Function

There are various models in the lab showing arteries and veins: Be sure to identify the vessels on ALL of these models. . ACTIVITY 4: IDENTIFYING VESSELS OF THE PULMONARY CIRCULATION Models of the chest, lungs, heart ACTIVITY 5: FETAL BLOOD FLOW There is a fetal model showing fetal circulatory modifications.

Eventually, the smallest arteries, vessels called arterioles, further branch into tiny capillaries, where nutrients and wastes are exchanged, and then combine with other vessels that exit capillaries to form venules, small blood vessels that carry blood to a vein, a larger blood vessel that returns blood to the heart.

drain tissues and return blood to the heart. Low pressure vessels so they have thinner walls. Lumens are larger than arteries however and valves in larger veins prevent backflow of blood. This is because blood returning to the heart often flows against gravity, so lumen has to be bigger to keep up with cardiac output.

Blood drained from the digestive viscera. 16. Why is this blood carried to the liver before it enters the systemic circulation? This blood is rich in nutrients. The liver is the key body organ responsible for maintaining proper blood concentrations of glucose, proteins, etc. Its phagocytes also cleanse the blood of debris.

Blood vessel, a vessel in the human or animal body in which blood circulates. The vessels that carry blood away from the heart are called arteries, and their very small branches are arterioles. Very small branches that collect the blood from the various organs and parts are called venules, and they unite to form veins, which return the blood to the heart.
